The present invention describes a library of human polynuclectides comprising the sequences given in 21233 to 21779. Also described is a method of detecting differentially expressed genes correlated with the cancerous state of a mammalian cell, comprising detecting at least one differentially expressed gene product in a test sample from a cell suspected of being cancerous, where the gene product is encoded by one of the 5248 polynucleotide sequences given in 212332 to 217779. The polynucleotides can be used as a source of primers and probes, which can be used for a variety of purpose, or detection of expression levels, mapping, tissue typing or profiling, forensics, genetic analysis and detection of polynuclotikans. Polypeptides encoded by the polynuclocides can be used for raising antibodies for experimental, diagnostic and therapeutic purposes. The polynuclocitides may also be used to construct arranged in a properties of detection of inflamostics (which may be used to determine function of an analysis for diagnostics.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      encoded protein); and to detect differences in expression levels between two cells (e.g. to identify abnormal or diseased tissue in a human, to identify a genetic predisposition or susceptibility to a disease such as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Titly a genetic predisposition or susceptibility to a disease such as per). The polynucleotides of the invention are especially used in the posits, prognosis and management of colorectal cancer, breast cancer, lung cancer. The polynucleotides can also be used to screen for
                                                                                                                                                                                                                                                                                                              Crkvenjakov R, Dickson M, Drmanac R, Drmanac S;

A00010 to A02716 represent polynucleotides isolated from cDNA libraries constructed from human colon cancer cell lines. The present invention also describes a method of detecting differentially expressed genes correlated with a cancerous state of a mammalian cell, comprising detecting at less one differentially expressed gene product in a test sample derived from a cell suspected of being cancerous, where detection of the differentially expressed gene product is correlated with a cancerous state of the cell from which the test sample was derived.

The polynucleotides sequences can be used in a method for detecting differentially expressed genes correlated with a cancerous state of a mammalian cell. The polynucleotides can also be used as probes for detecting and mapping related genes. They can be used in diagnosis and prognosis of diseases and disorders (e.g. identification of
                                                                                                   pre-metastatic or metastatic cancerous states, stages of cancer, or responsiveness of cancer to therapy). This is particularly for breast cancer, oestrogen receptor-positive breast cancer, oestrogen receptor negative breast cancer, and colon cancer.
                                                                                                                                                                                                                                                                                                                                                                                       508 CCCGNNCGCTCCNNCAACNNCGGCCTCCCCAGNNCGCCATTCCCNCNCCGCCCNNTCAAG 549

double-stranded DNA (or its complementary strand or the corresp.

double-stranded DNA) which comprises one of the 7837 "GS" sequences
given in T19001-T26837 and which is able to hybridise to part of
given in T19001-T26837 and which is able to hybridise to part of
human genomic DNA, cDNA or mRNA is claimed. The GS (Gene Signature)
sequences were obtained from 3'-directed cDNA libraries prepared
from various human tissues; syntheais of cDNA was initiated from the
GY and mRNA by using poly(T) as the sole primer. Since the 3'-
untranslated sequence is unique to a particular mRNA species, almost
all the 3'-oriented cDNAs hybridise with specific mRNAs. Each library
is constructed so as to reflect accurately the relative abundance of
different mRNAs in the particular tissue from which it was derived.
The appearance frequency of a given GS in a cDNA library can be
determined (sep. using primers and probes derived from the GS
sequences) as a means of diagnosing abnormal cell function or for

The present sequence is the cDNA encoding human cyclic nucleotide associated protein-2 (CNAP-2), identified in Incyte clone 3149674, that is isolated from ADREMONG CDNA library. It is expressed in nervous, reproductive, cardiovascular and haematopoietic/immune tissues. CNAP sequences may be used for prevention, treatment and diagnosis of diseases associated with altered CNAP expression such as, cell proliferative disorders (e.g. arteriosclerosis, cirrhosis, leukaemia, lymphoma and cancer of the breast, prostate, lung and brain), autoimmune/ inflammatory disorders (e.g. asthma, anaemia, diabetes mellitus, multiple sclerosis and psoriasis), neurological disorders (e.g. epilepsy, conjunctivitis, glaucoma, cataracts and strokes), vision disorders (e.g. reproductive disorders (e.g. infertility, uterine fibroids, ectopic pregnancies and impotence) and smooth muscle disorders (e.g. angina, musch fellos chock, Kearns-Sayre syndrome and hypertension). It can also
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ς;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  967 accagccctgtgcggggctccaagaatggtcagcacctcagctacagacgagccagg 1026

The specification describes antisense oligonuclectides (x52869-x55271) directed against at least 2 mRNas selected from target genes, coding and non-coding regions of RNAs corresponding to target genes, gene initiation codons, genomic flanking regions, intron-exon borders, the 5'-end, the 3'-end and the juxta-section between coding and non-coding regions and all segments of RNAs encoding proteins associated with one or more diseases, conditions or mixtures. The antisense oligonucleotides of specifically x55180-271 can be used for the antisense treatment of diseases and conditions. Typical diseases and conditions are those associated with impaired respiration and inflammation, including lung diseases, pulmonary vasoconstriction, inflammation,

                                                                                                                                                                                                                                                                                             A00010 to A02716 represent polynucleotides isolated from cDNA libraries constructed from human colon cancer cell lines. The present invention also describes a method of detecting differentially expressed genes correlated with a cancerous state of a mammalian cell, comprising detecting at least one differentially expressed gene product in a test sample derived from a cell suspected of being cancerous, where detection of the differentially expressed gene product is correlated with a cancerous state of the cell from which the test sample was derived. The polynucleotides sequences can be used in a method for detecting differentially expressed genes correlated with a cancerous state of ammanian cell. The polynucleotides can also be used as probes for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            detecting and mapping related genes. They can be used in diagnosis and prognosis of diseases and disorders (e.g. identification of prognosis of diseases and disorders (e.g. identification of permetastatic cancerous states, stages of cancer, or responsiveness of cancer to therapy). This is particularly for breast cancer, oestrogen receptor-positive breast cancer, oestrogen receptor-

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Sequence 10, Sequence 10, Sequence 10, Sequence 11, Sequence 11, Sequence 10,

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                        823

                                        Cardiovascular diseases by novel human genes which are differentially expressed in different cardiovascular disease states. Compositions which can modify Tor-beta signaling pathway are identified by screening. These are used therapeutically to treat fibroproliferative and oncogenic disorders, especially ToF (Transforming growth factor)-beta related cancer, anglogenesis, including diabetic retinopathy, artheroscierosis, pancreatic cancer, anglogenesis, inflammation, fibrosis, tumour growth and growth and growth is up-regulated in monocytes treated with oxidised LDI. (low density lipoprotein) can be used to design cardiovascular disease (treatment strategies. Depending on whether the up-regulation has a pathogenic or protective effect treatment methods can be designed to increase or decrease the activity of the protein product of the gene.
                              palent discloses methods for the treatment and diagnosis of ilovascular diseases by novel human genes which are differentially

This protein is encoded by the novel human fichd605 gene (swift) that is up-regulated in monocytes treated with oxidised low density lipoproteins that simulate the conditions under which foam cells develop during atherogenesis. The protein has sequence similarity to the mouse gly96 gene and to EST T49532. Novel fichd531, fichd540, fichd540, fichd602 and fichd605 genes (see T94467-71) provide a fingerprint for the study of cardiovascular diseases, including atherosclerosis, ischaemia/reportusion, hypertension, restenosis and arterial inflammation. Methods are provided for the diagnosis, monitoring in clinical trials, screening for therapeutically effective compounds, and treatment of cardiovascular diseases based on discoveries regarding the expression patterns of these novel genes.

This sequence shows the central portion, including the C-terminus of the alpha-helix region and some of the proline-rich region, of premococcal surface protein A (PspA) of Stroptococcus pneumoniae strain E6796. Comparison of the N-terminal and central regions (W14533-57 and W14562-91) of PspA polypeptides from different pneumococcal strains can be used to divide the strains into several families based on sequence homologies. PspA polypeptides, or ragaments of them, can be used in vaccines to protect animals against S. pneumoniae infection and hence for the prevention of diseases such as otitis media, meningitis, bacteraemia and pneumonia. The sequence of the 3' half of the PspA alpha-helical region and the immediate S' tip of the coding sequence are likely to be the critical sequences for predicting PspA cross-reactions and vaccine
                6; Fig 13; 296pp; English.

                                                                                                     pneumococcal surface protein A (PspA) of Streptococcus preumoniae strain Db15. Comparison of the N-terminal and central regions (W14533-57 and W14562-91) of PspA polypeptides from different pneumococcal strains can be used to divide the strains into several families based on sequence homologies. PspA polypeptides, or fragments of them, can be used in vaccines to protect animals against S. pneumoniae infection and hence for the prevention of

                                                                                                                                                                                                                                                                                                                                                                                               This sequence shows the central portion, including the C-terminus of the alpha-helix region and some of the proline-rich region, of pneumococcal surface protein A (PspA) of Streptococcus pneumoniae strain B99163. Comparison of the N-terminal and central regions (W14533-57 and W14562-91) of PspA polypeptides from different pneumococcal strains can be used to divide the strains into several families based on sequence homologies. PspA polypeptides, or Iragments of them, can be used in vaccines to protect animals against S. pneumoniae infection and hence for the prevention of diseases such as otitis media, meningitis, bacteraemia and pneumonia. The sequence of the 3' half of the PspA alpha-helical region and the immediate S' tip of the coding sequence are likely to be the critical population.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           16 APTPAPSTIPGPRRGSGPEIFTFDPLPEPAAAPAGRPSASKGHRKRSRRVLYPRVVRRQL, 75

This sequence shows the central portion, including the C-terminus of the alpha-helix region and some of the proline-rich region, of pneumococcal surface protein A (PspA) of Streptococcus pneumoniae strain 092134c. Comparison of the N-terminal and central regions (W14533-57 and W14562-91) of PspA polypeptides from different pneumococcal strains can be used to divide the strains into several families based on sequence homologies. PspA polypeptides, or fragments of them, can be used in vaccines to protect animals against S. pneumoniae infection and hence for the prevention of the sequence of the 3' half of the PspA alpha-helical region and the immediate 5' tip of the coding sequence are likely to be the critical and manners for predicting PspA cross-reactions and vaccine
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             98 etpapapapapapek-----paekpapapapekpapapek-----paekpae 139

strain Bg9739. Comparison of the N-terminal and central regions (W14533-57 and W14562-91) of PspA polypeptides from different pneumococcal strains can be used to divide the strains into several lamilies based on sequence homologies. PspA polypeptides, or Iraquents of them, can be used in vaccines to protect animals against S. pneumoniae infection and hence for the prevention of diseases such as offits media, meningitis, bacteraemia and pneumonia. The sequence of the 3' half of the PspA alpha-helical region and the immediate 5' tip of the coding sequence are likely to be the critical sequences for predicting PspA cross-reactions and vaccine

c a mouse brain cDNA library. Neural Menai contains an exon that introduces 244 amino acids between amino acids 238 and 239 of mammalian Ena (Mena, see W37148). Two other Lasoforms, neural Mena++ (see W37153), are also disclosed. Unlike Mena, neural Mena isoforms exhibit neural Mena++ (see W37153), are also disclosed. Unlike Mena, neural Mena isoforms exhibit neural tissue-specific distribution. Based on the disclosed Mena and EVI genes (see also V02996-97) and proteins (see also W37148-49), a variety of methods and compositions are provided for screening, isolating and characterising endogenous and exogenous factors, drugs and therapeutic agents useful to evaluate and/or control cytoskeletal dynamic events involved in normal and abnormal cell morphology, adhesion, mothlity, growth and/or differentiation. A method of detecting a modulator of Mena activity/expression is

9
This protein comprises novel murine neural Mena++. Its amino acid sequence was deduced from a cDNA clone obtained from a mouse brain cDNA library. Two other isoforms, neural Mena+ (see W37151) and neural Mena+ (see W37151) and neural Mena+ (see W37151) and neural Mena+ (see W37148), are also disclosed. Unlike mammalian Ena (Mena, see W37148), neural Mena isoforms exhibit neural clissue-specific distribution. Based on the disclosed Mena and Evl. (see Specific distribution. Based on the disclosed Mena and Evl. (see Specific distribution. Based on the disclosed Mena and Evl. (see Specific distribution. Based on the disclosed Mena and Evl. (see Specific distributions are provided for screening, solating and characterising endogenous and exogenous factors, isolating and characterising endogenous and exogenous factors, cytoskeletal dynamic events involved in normal and abnormal cell morphology, adhesion, motility, growth and/or differentiation. A complete of detecting a modulator of Mena activity/expression is

protein.
in a
This protein comprises novel murine neural Mena++. Its amino acid sequence was deduced from a CDNA clone obtained from a mouse brain CDNA library. Two other isoforms, neural Mena+ (see W37151) and neural Mena, see W37152), are also disclosed Unlike mammalian can (Mena, see W37148), neural Mena isoforms exhibit neural cissue-specific distribution. Based on the disclosed Mena and Evl genes (see also V02996-98) and proteins (see also W37148-49), a variety of methods and compositions are provided for screening, isolating and characterising endogenous and exogenous factors, isolating and characterising endogenous and exogenous factors, cutys and therapeutic agents useful to evaluate and/or control cytoskeletal dynamic events involved in normal and abnormal cell morphology, adhesion, motility, growth and/or differentiation. A method of detecting a modulator of Mena activity/expression is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Identifying modulators of nuclear receptors, useful e.g. as anticancer and anti-inflammatory agents, according to their effect on binding between the receptor and high-mobility group protein

٠.
ligand dependent manner to induce gene expression can be identified using the method of the invention. The specification describes a method for identifying compounds that modulate a nuclear receptor. The method comprises incubating a polypeptide containing presence of second polypeptide containing the nuclear receptor-binding part of a INW protein, and detecting any alteration in binding between the two polypeptides. The method is useful for identifying potential antipoliferative, anti-inflammatory, antipsoriasis and anticancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Identifying modulators of nuclear receptors, useful e.g. as anticancer and anti-inflammatory agents, according to their effect on binding between the receptor and high-mobility group protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   protein.

```
liquad-binding region of nuclear receptor with test compound in presence of second polypeptide containing the nuclear receptor-binding part of a HMG protein, and detecting any alteration in binding between the two polypeptides. The method is useful for identifying potential antiproliferative, anti-inflammatory, antipsoriasis and anticancer

Gene 036 is a candidate tumour suppressor gene. A correlation was found between an increase in the expression level of gene 036 and a decrease in a colon cell's tumour potential. Hence, methods that increase the level of expression of gene 036 may inhibit or slow the progression to tumours and cancer. e.g. colon cancer. The 036 protein is used in claimed methods for treating a patient suffering from a disorder associated with

or inhibit the formation of Ras-Sos complex are useful in the treatment of cancer. The present sequence represents a Drosophila

8

13;

```
The specification describes a crystal complex comprising at least a Son of sevenless Sos contacting region of a Ras protein and at least a Son of sevenless (Sos) protein catalytic region fragment, that effectively diffracts rays. Ras and Sos form a tight complex. Sos does not impede the binding sites for the nucleotide base and the ribose of GTP or GDP and thus the Ras-Sos complex maintains a structure that permits and thus the Ras-Sos complex maintains a structure that permits of uncleotide release and rebinding. The crystals are used for the of more than 5.0 Angstrom. The crystals are used for the crimination of the atomic coordinates of the complex to a resolution of three-dimensional coordinates obtained from the crystals, is useful for identifying an agent that stabilizes the Ras-Sos complex. The crystals are also useful for identifying agents that inhibit the crystals are also useful for identifying agents that inhibit the growing a crystal of a protein-ligand complex. Agents that stabilize

member - PEA3-beta. The gene was isolated from a HepG2 cell line cDNA library. The probe for the screening was prepared by reverse transcription on HepG2 mRNA followed by PCR using primers 03170-1, to produce a probe of 170-200 bp. The screening isolated the full length sequence of the transcription factor. The gene was inserted into the expression vectors pBluescript KS and pcDV1 for expression of the protein in E.coli and COS7 cells, respectively. The FTS transcription factor has specificity for and is activated by ras. It is useful as a reagent in studies for the elucidation of the mechanism of cancer cell multiplication or polyoma virus transformation of cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     162 hapaagpvqqv--gpapaphslpep----gpqqqtf-avprpphqplqmp-----kmm 207
